

## Genetic stability

### Description

Our group is devoted to analyze the factors that govern genetic stability in bacteria and the mechanisms of horizontal gene transfer, using *Bacillus subtilis* and the bacteriophage SPP1 as the models.

### Members of the group

Juan Carlos Alonso  
Silvia Ayora  
Begoña Carrasco  
María Moreno del Alamo  
Rubén Torres  
Cristina Ramos  
Chiara Marchisone  
María López Sanz  
Paula Pérez Junquera

### Research topics

Homologous recombination. Our research focuses in: i) analyzing the proteins that control the RecA recombinase, as DisA, RadA, PcrA, and RecD2; and ii) analyze how recombination proteins may participate in the process of replication restart after fork stalling or fork collapse

Natural competence. We analyze: i) the mechanisms and recombination proteins responsible for the acquisition of interspecies DNA, and ii) the impact of chromosome structure in the acquisition of interspecies DNA

Bacteriophages We are analyzing: (i) how bacteriophages may contribute to the acquisition of antibiotic resistances; (ii) phage SPP1 DNA replication as a model of recombination-dependent replication

Segregational stability. We study how toxin-antitoxin systems contribute to segregations stability using plasmid pSM19035 as a model.
